

Before You Build: Is Your Organization Actually AI-Ready?

"Most AI product failures don't happen at the idea stage — they happen because the organization wasn't set up to support what it was building."

This course covers your role, your team, and how to communicate AI's value. But there's a foundational layer beneath all of that: **operational readiness** — whether your organization is genuinely prepared to integrate and sustain an AI-powered product.

Four Pillars of Readiness

01

People & Skills

Do the right roles exist? Any gaps needing hiring or upskilling?

02

Process Clarity

Who reviews AI outputs? What's the plan when the model is wrong?

03

Technology Fit

Does existing infrastructure support the AI component?

04

Stakeholder Buy-In

Who still needs convincing? Skepticism at senior levels can derail initiatives.

Three of the four pillars are non-technical. Operational readiness is largely a people and process challenge — which puts it squarely in the AI PM's court.

Data Point: McKinsey's State of AI research finds that top-performing AI organizations are differentiated not by the technology they use, but by formal governance, cross-functional teams, and documented deployment processes.

A Quick Self-Check for Your Team

- If the model makes a wrong prediction, what's our process to catch and correct it?
- Which stakeholders are still unconvinced — and what would change that?
- What does success look like at 6 months, and who owns measuring it?

Which of the four readiness pillars do you think is most often underestimated — and why?

- Think of an org you've seen or worked in. Which pillar would've been the weakest link?
- As an AI PM, what's one action you'd take in your first 30 days to strengthen it?
